

A bubble plot showing the relationship between Somatic.Mutation.Type (X-axis) and Somatic.Mutation.Freq. (Y-axis). The X-axis lists 48 somatic mutation types, and the Y-axis represents the frequency. The size of each bubble indicates the number of genes affected by that mutation type. The plot shows that C>T and C>G mutations are the most frequent and affect the most genes, while T>G and T>C mutations are the least frequent and affect the fewest genes.
